

[illegible]

A box plot showing the distribution of CSD (Y-axis, ranging from 0e+00 to 4e-04) for different values of Cp (X-axis, ranging from 1 to 21). The plot shows that the median CSD is relatively stable across all Cp values, around 1.2e-04. The interquartile range (IQR) is also stable, spanning from approximately 0.6e-04 to 2.2e-04. The whiskers extend from approximately 0.1e-04 to 4.5e-04. There are no significant differences in the distribution of CSD across the different Cp values.
