

[illegible]

Box plot showing the coefficient of standard deviation (csd) for different values of  $C_p$  (1 to 21). The y-axis represents csd, ranging from 0e+00 to 6e-04. The x-axis represents  $C_p$ . The plot shows that the median csd is relatively stable around 1.5e-04, while the upper whisker values decrease slightly as  $C_p$  increases.
