

[illegible]

Box plot showing the distribution of csd values for different Cp values (1 to 21). The y-axis represents csd (ranging from $0e+00$ to $8e-04$), and the x-axis represents Cp (ranging from 1 to 21). The plot displays orange boxes with black medians and whiskers. The median csd values are relatively stable, around $3.5e-04$, while the whiskers show a decreasing trend as Cp increases.
