

[illegible]

Box plot showing the coefficient of standard deviation (csd) for different values of C_p (1 to 21). The y-axis represents csd, ranging from 0e+00 to 6e-04. The x-axis represents C_p . The plot shows that the median csd is relatively stable around 2e-04, but the variance (indicated by the length of the whiskers) decreases as C_p increases.
